This mathematical fact turns out to have an important physical consequence. Let  $x(t)$  be a physical trajectory for a particle in a force field for which  $x(0) \sim x_0$  is a point of equilibrium; that is, a point where the force field vanishes. Then if  $x'(0) \sim 0$  then  $x(t) \sim x_0$  for all  $t$ . Indeed, the constant trajectory  $x(t) \sim x_0$  for all  $t$  obeys ...

THE PRINCIPLES OF MATHEMATICAL PHYSICS. 5 true whatever may be the details of the invisible mechanism which animates them. The principle of the conservation of energy, or the principle of Mayer, is certainly the most important, but it is not the only one ; there are others from which we are able to draw the same advantage. These are :

When the method was introduced, nearly fifty years ago, physicists did the best they could to justify it, using variational principles, intuition, and other techniques within the texture of physical reasoning. By now the method has long since become

Following mathematics: the theory of partial differential equation, variational calculus, Fourier analysis, potential theory, and vector analysis are perhaps most closely associated with mathematical physics. These were developed intensively from the second half of the 18th century (by, for example, D'Alembert, Euler, and Lagrange) until the 1930s.

The mathematical theorems that can be proved now (mostly for two- and three-electron systems, hence of limited interest for physics), have to be regarded as mathematics. If they are good mathematics (and I believe they are), that is justification enough.
